Information on toxicological effects

Symptoms Large doses of cypermethrin ingested by laboratory animals produced signs of toxicity including loss of motor control, tremors, decreased activity, urinary incontinence, incoordination, increased sensitivity to sound and convulsions.

Delayed and immediate effects as well as chronic effects from short and long-term exposure

Chronic toxicity Cypermethrin: Long-term exposure caused neurotoxicity (body tremors, decreased motor activity), decreased body weight and increased liver and spleen weight.  
 Mutagenicity Cypermethrin: Not genotoxic in laboratory studies.  
 Carcinogenicity Cypermethrin caused an increase in benign lung tumors in mice, but not in rats. EPA has classified cypermethrin as a possible human carcinogen based on this information, but does not regulate based on its low cancer risk.  
 Neurological effects Cypermethrin: Causes clinical signs of neurotoxicity (body tremors, decreased motor activity and impaired gait) following acute, subchronic or chronic exposure.  
 Reproductive toxicity Cypermethrin: No toxicity to reproduction in animal studies.  
 Developmental toxicity Cypermethrin: Not teratogenic in animal studies.  
 STOT - single exposure May cause respiratory irritation. See listed target organs below.  
 STOT - repeated exposure May cause damage to organs through prolonged or repeated exposure. See listed target organs below.  
 Target organ effects  
 Neurological effects Cypermethrin: Central Nervous System.  
 Cypermethrin: Causes clinical signs of neurotoxicity (body tremors, decreased motor activity and impaired gait) following acute, subchronic or chronic exposure.  
 Aspiration hazard No information available.
